PAPER 32: Mechanics

You must have:

Mathematical Formulae and Statistical Tables (Green), calculator

Total Marks

**Candidates may use any calculator allowed by Pearson regulations.
Calculators must not have the facility for symbolic algebra manipulation,
differentiation and integration, or have retrievable mathematical formulae
stored in them.**

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided
 - *there may be more space than you need.*
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Unless otherwise indicated, whenever a value of g is required, take $g = 9.8 \text{ m s}^{-2}$ and give your answer to either 2 significant figures or 3 significant figures.

Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- The total mark for this part of the examination is 50. There are 5 questions.
- The marks for **each** question are shown in brackets
 - *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

Q1/1/1/1/

P 7 2 1 3 1 A 0 1 2 0

Pearson

1. [In this question, position vectors are given relative to a fixed origin.]

At time t seconds, where $t > 0$, a particle P has velocity v m s^{-1} where

$$\mathbf{v} = 3t^2\mathbf{i} - 6t^{\frac{1}{2}}\mathbf{j}$$

- (a) Find the speed of P at time $t = 2$ seconds.

(2)

- (b) Find an expression, in terms of t , \mathbf{i} and \mathbf{j} , for the acceleration of P at time t seconds, where $t > 0$

(2)

At time $t = 4$ seconds, the position vector of P is $(\mathbf{i} - 4\mathbf{j})$ m.

- (c) Find the position vector of P at time $t = 1$ second.

a) $\mathbf{v} = \begin{pmatrix} 3t^2 \\ -6t^{\frac{1}{2}} \end{pmatrix} = \begin{pmatrix} 3 \times 2^2 \\ -6 \times 2^{\frac{1}{2}} \end{pmatrix} = \begin{pmatrix} 12 \\ -6\sqrt{2} \end{pmatrix}$ (4)

$$v = \sqrt{12^2 + (-6\sqrt{2})^2} = 6\sqrt{6} \text{ ms}^{-1}$$

b) differentiating \mathbf{v}

$$\mathbf{a} = \begin{pmatrix} 6t \\ -3t^{-\frac{1}{2}} \end{pmatrix}$$

c) integrating \mathbf{v}

$$\mathbf{s} = \left(-6 \times \frac{2}{3} t^{\frac{3}{2}} \right) + \begin{pmatrix} \mathbf{a} \\ \mathbf{b} \end{pmatrix}$$

$$\text{at } t = 4 \quad \mathbf{s} = \begin{pmatrix} \mathbf{a} \\ -4 \end{pmatrix}$$

$$\left(\begin{pmatrix} t^3 \\ -4t^{\frac{1}{2}} \end{pmatrix} + \begin{pmatrix} \mathbf{a} \\ \mathbf{b} \end{pmatrix} \right) = \begin{pmatrix} \mathbf{a} \\ -4 \end{pmatrix}$$

$$64 + \mathbf{a} = 1 \quad \mathbf{a} = -63$$

$$-4 \times 4^{\frac{1}{2}} + \mathbf{b} = -4$$

$$-32 + \mathbf{b} = -4$$

$$\mathbf{b} = 28$$

Question 1 continued

$$\therefore \tilde{C} = \begin{pmatrix} t^3 & -63 \\ -4t^2 & +28 \end{pmatrix}$$

$$at \quad t = 1$$

$$\tilde{C} = \begin{pmatrix} 1 & -63 \\ -4 & +28 \end{pmatrix} = \begin{pmatrix} -62 \\ 24 \end{pmatrix}$$

(Total for Question 1 is 8 marks)

P 7 2 1 3 1 A 0 3 2 0

2.

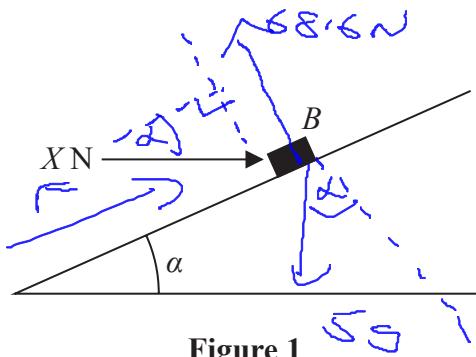

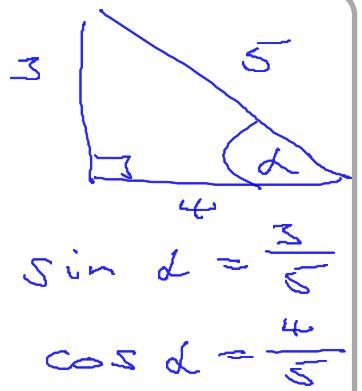

Figure 1

A rough plane is inclined to the horizontal at an angle α , where $\tan \alpha = \frac{3}{4}$

A small block B of mass 5 kg is held in equilibrium on the plane by a horizontal force of magnitude X newtons, as shown in Figure 1.

The force acts in a vertical plane which contains a line of greatest slope of the inclined plane.

The block B is modelled as a particle.

The magnitude of the normal reaction of the plane on B is 68.6 N.

Using the model,

(a) (i) find the magnitude of the frictional force acting on B ,

(3)

(ii) state the direction of the frictional force acting on B .

(1)

The horizontal force of magnitude X newtons is now removed and B moves down the plane.

Given that the coefficient of friction between B and the plane is 0.5

(b) find the acceleration of B down the plane.

(6)

R (\rightarrow) parallel to plane

$$X \cos \alpha + F = 5g \sin \alpha \quad (1)$$

R (\perp) perpendicular to plane

$$68.6 = X \sin \alpha + 5g \cos \alpha \quad (2)$$

Limiting friction $F = \mu R = 0.5 \times 68.6 \quad (3)$

(2) gives $X = \frac{68.6 - 0.5 \times 68.6 \times \frac{4}{5}}{\frac{3}{5}}$

$$X = 49 \text{ N}$$

Question 2 continued

in (1) $F = 5 \times 9.8 \times \frac{1}{5} - 49 \times \frac{1}{5} F$

$$F = -9.8 N$$

i) $F = 9.8 N$

ii) direction is down the plane

b) $F = \mu \times R = 0.5 R$ (1)

Equation of motion parallel to plane

$$5 \times a = 5g \sin \alpha - F \quad (2) \quad (\leftarrow)$$

Equation of motion perpendicular to plane (\uparrow)

$$0 = R - 5g \times \cos \alpha$$

$$R = 5 \times 9.8 \times \frac{4}{5} = 39.2 N$$

in (1) $F = 0.5 \times 39.2 = 19.6 N$

in (2) $a = \frac{5 \times 9.8 \times \frac{3}{5} - 19.6}{5}$

$$a = 1.96 m s^{-2}$$

3.

[In this question, \mathbf{i} and \mathbf{j} are horizontal unit vectors.]

A particle P of mass 4kg is at rest at the point A on a smooth horizontal plane.

At time $t = 0$, two forces, $\mathbf{F}_1 = (4\mathbf{i} - \mathbf{j})\text{N}$ and $\mathbf{F}_2 = (\lambda\mathbf{i} + \mu\mathbf{j})\text{N}$, where λ and μ are constants, are applied to P

Given that P moves in the direction of the vector $(3\mathbf{i} + \mathbf{j})$

(a) show that

$$\lambda - 3\mu + 7 = 0 \quad (4)$$

At time $t = 4$ seconds, P passes through the point B .

Given that $\lambda = 2$

(b) find the length of AB .

$$a) \tilde{\mathbf{F}} = \tilde{\mathbf{F}}_1 + \tilde{\mathbf{F}}_2 = \begin{pmatrix} 4 + \lambda \\ -1 + \mu \end{pmatrix} \quad \begin{matrix} \downarrow \mathbf{i} \\ \downarrow \mathbf{j} \end{matrix} \quad (5)$$

moving in direction $(3, 1)$

$$\therefore \frac{4 + \lambda}{-1 + \mu} = \frac{3}{1}$$

$$\begin{aligned} 4 + \lambda &= -3 + 3\mu \\ 4 + \lambda + 3 - 3\mu &= 0 \\ \lambda - 3\mu + 7 &= 0 \quad (\text{as required}) \end{aligned}$$

$$b) \lambda = 2 \quad 2 - 3\mu + 7 = 0 \\ \mu = 3 \quad \mu = 3$$

$$\begin{aligned} \tilde{\mathbf{F}} &= m \tilde{\mathbf{a}} \\ \tilde{\mathbf{a}} &= \frac{\tilde{\mathbf{F}}}{m} = \frac{1}{4} \begin{pmatrix} 6 \\ 2 \end{pmatrix} \\ &= \begin{pmatrix} 1.5 \\ 0.5 \end{pmatrix} \end{aligned}$$

$$\tilde{\mathbf{r}} = \tilde{\mathbf{u}} t + \frac{1}{2} \times \tilde{\mathbf{a}} \times t^2$$

Question 3 continued

$$\text{r} = 0 + \frac{1}{2} \times \left(\begin{array}{c} -1 \\ 0.4 \end{array} \right) x + \text{r}$$

$$\text{r} = \left(\begin{array}{c} -2 \\ 4 \end{array} \right) \quad \text{point } B$$

$$\text{length } AB = \sqrt{12^2 + 4^2}$$

$$= 4\sqrt{10} \text{ m}$$

4.

**Figure 2**

A uniform rod AB has mass M and length $2a$

A particle of mass $2M$ is attached to the rod at the point C , where $AC = 1.5a$

The rod rests with its end A on rough horizontal ground.

The rod is held in equilibrium at an angle θ to the ground by a light string that is attached to the end B of the rod.

The string is perpendicular to the rod, as shown in Figure 2.

- (a) Explain why the frictional force acting on the rod at A acts horizontally to the right on the diagram.

(1)

The tension in the string is T

- (b) Show that $T = 2Mg \cos \theta$

(3)

Given that $\cos \theta = \frac{3}{5}$

- (c) show that the magnitude of the vertical force exerted by the ground on the rod at A

$$\text{is } \frac{57Mg}{25}$$

(3)

The coefficient of friction between the rod and the ground is μ

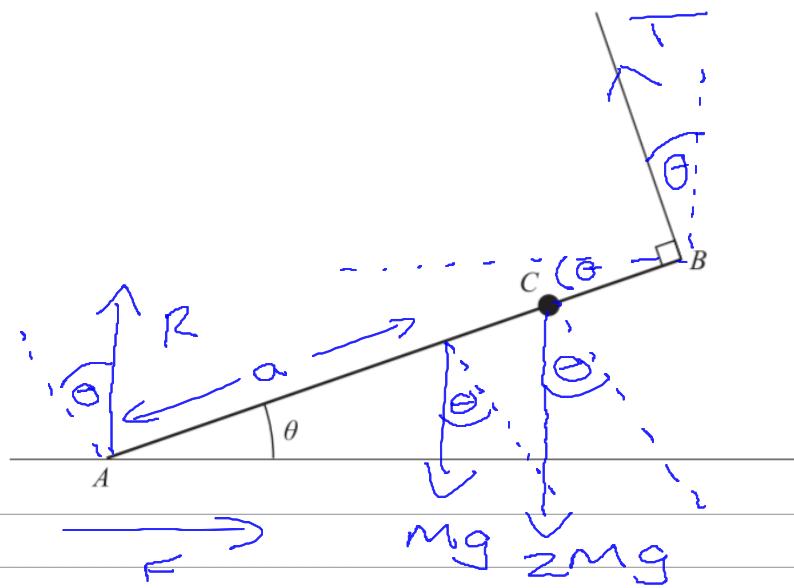

Given that the rod is in limiting equilibrium,

- (d) show that $\mu = \frac{8}{19}$

(4)

Question 4 continued

a) If we resolve horizontally, only F and T have horizontal components. As T is left, F must act to the right.

b) $m(A)$

$$a \times Mg \cos \theta + 1.5ax 2mg \cos \theta = 2axT$$

$$4amg \cos \theta = 2aT$$

$$2mg \cos \theta = T$$

(as required)

c) $R(\uparrow)$

$$R + \frac{T}{\cos \theta} = 3mg$$

$$R + (2mg \cos \theta) \cos \theta = 3mg$$

$$R + 2mg \times \left(\frac{3}{5}\right)^2 = 3mg$$

$$R = 3mg - \frac{18}{25}mg$$

$$R = \frac{57}{25}mg$$

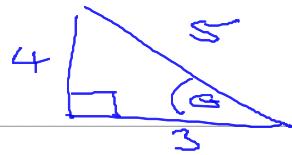

Question 4 continued

$$d) F = \mu R$$

$$R (\rightarrow) F = T \sin \theta$$

$$\sin \theta = \frac{4}{5}$$

$$F = 2mg \cos \theta \times \frac{\sin \theta}{4}$$

$$F = 2mg \times \frac{3}{5} \times \frac{4}{5}$$

$$F = \frac{24}{25} mg$$

Limiting Friction

$$F = \mu R$$

$$\mu = \frac{F}{R} = \frac{\frac{24}{25} mg}{\frac{57}{25} mg} = \frac{8}{19}$$

$$\mu = \frac{24}{57} = \frac{8}{19}$$

(as required)

5.

**Figure 3**

A golf ball is at rest at the point A on horizontal ground.

The ball is hit and initially moves at an angle α to the ground.

The ball first hits the ground at the point B , where $AB = 120\text{ m}$, as shown in Figure 3.

The motion of the ball is modelled as that of a particle, moving freely under gravity, whose initial speed is $U\text{ m s}^{-1}$

Using this model,

(a) show that $U^2 \sin \alpha \cos \alpha = 588$ (6)

The ball reaches a maximum height of 10 m above the ground.

(b) Show that $U^2 = 1960$ (4)

In a refinement to the model, the effect of air resistance is included.

The motion of the ball, from A to B , is now modelled as that of a particle whose initial speed is $V\text{ m s}^{-1}$

This refined model is used to calculate a value for V

(c) State which is greater, U or V , giving a reason for your answer. (1)

(d) State one further refinement to the model that would make the model more realistic. (1)

$$(\rightarrow) \text{ motion } U \cos \alpha \times t = 120 \quad \text{distance from } A \text{ to } B \quad (1)$$

$$\begin{aligned} (\uparrow) \text{ motion true} \quad s &= 0 \\ U &= U \sin \alpha \\ U &= \\ a &= -g \\ t & \end{aligned}$$

$$s = ut + \frac{1}{2} at^2$$

Question 5 continued

$$s = Us \sin \alpha t + \frac{1}{2} x - 9.8 \times t^2 \quad (2)$$

$$\textcircled{1} \text{ gives } t = \frac{120}{U \cos \alpha}$$

\textcircled{1} in \textcircled{2} gives

$$0 = \cancel{x} \sin \alpha \times 120 - 4.9 \left(\frac{120}{U \cos \alpha} \right)^2$$

$$4.9 \times \left(\frac{120}{U \cos \alpha} \right)^2 = \frac{120 \sin \alpha}{\cos \alpha}$$

$$\frac{4.9 \times 120^2}{U^2 \cos^2 \alpha} = \frac{120 \sin \alpha}{\cos \alpha}$$

$$70560 = \frac{120 \sin \alpha}{\cos \alpha} \times U^2 \cos \alpha \cancel{\cos \alpha}$$

$$\frac{70560}{120} = U^2 \sin \alpha \cos \alpha$$

$$588 = U^2 \sin \alpha \cos \alpha \quad \textcircled{1} \\ (\text{as required})$$

b) R(t) +ve

$$s = 10 \quad v^2 = U^2 + 2as$$

$$0 \approx Us \sin \alpha \quad 0 = U^2 \sin^2 \alpha + 2 \times -9.8 \times 10$$

$$v = 0 \quad U^2 \sin^2 \alpha = 196$$

$$a = -9.8$$

$$t \quad U^2 = \frac{196}{\sin^2 \alpha} \quad \textcircled{2}$$

Sub \textcircled{2} in \textcircled{1}

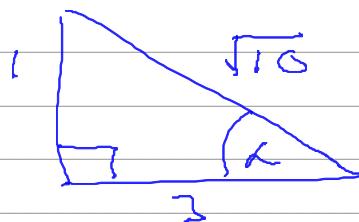

$$588 = \frac{196}{\sin^2 \alpha} \times \sin \alpha \cos \alpha$$

$$\frac{\sin \alpha}{\cos \alpha} = \frac{196}{588} \Rightarrow \tan \alpha = \frac{196}{588}$$

$$\tan \alpha = \frac{196}{588}$$

Question 5 continued

$$\therefore \sin \alpha = \frac{1}{\sqrt{10}}, \cos \alpha = \frac{3}{\sqrt{10}}$$

using (2)

$$v^2 = \frac{19.6}{\left(\frac{1}{\sqrt{10}}\right)^2}$$

$$v^2 = 1960$$

(as required)

c) If it is still to reach 120m horizontally v must be greater to overcome the air resistance.

d) wind

spin of ball
size of ball
shape of ball
